Abstract

This systematic review synthesizes a decade of peer-reviewed research (2015–2025) examining the interplay of filter bubbles, echo chambers, and algorithmic bias in shaping youth engagement within social media. A total of 30 studies were analyzed, using the PRISMA 2020 framework, encompassing computational audits, simulation modeling, surveys, ethnographic accounts, and mixed-methods designs across diverse platforms, including Facebook, YouTube, Twitter/X, Instagram, TikTok, and Weibo. Results reveal three consistent patterns: (i) algorithmic systems structurally amplify ideological homogeneity, reinforcing selective exposure and limiting viewpoint diversity; (ii) youth demonstrate partial awareness and adaptive strategies to navigate algorithmic feeds, though their agency is constrained by opaque recommender systems and uneven digital literacy; and (iii) echo chambers not only foster ideological polarization but also serve as spaces for identity reinforcement and cultural belonging. Despite these insights, the evidence base suffers from geographic bias toward Western contexts, limited longitudinal research, methodological fragmentation, and conceptual ambiguity in key definitions. This review highlights the need for integrative, cross-cultural, and youth-centered approaches that bridge empirical evidence with lived experiences.

Keywords: algorithmic bias; filter bubbles; echo chambers; youth engagement; social media; polarization; media literacy

1. Introduction

Over the past decade, social media platforms have become the primary arenas where young people communicate, learn, and construct their worldviews. Platforms such as Instagram, TikTok, YouTube, and X (formerly Twitter) serve not only as entertainment hubs but also as central sources of news and information for this generation, shaping both the content they encounter and the ways they interpret it [1,2]. Yet the architecture of these platforms is not neutral. It is powered by complex recommender systems, social media algorithms designed to filter, rank, and suggest content based on users' inferred preferences and behaviors [3,4]. While these algorithms offer a highly personalized and engaging experience, they also introduce significant risks. Social media algorithms operate by analyzing user behaviors, such as clicks, shares, and time spent on particular posts, to predict

and recommend content that aligns with those behaviors [5]. Although this personalization enhances convenience and relevance, it can simultaneously limit exposure to diverse perspectives, reinforcing a fragmented information environment that mirrors existing beliefs [3]. Recent advances in propaganda detection highlight the potential of hierarchical graph-based integration networks to identify misinformation with high accuracy across diverse contexts, including during crises like COVID-19 [6]. Such approaches illustrate how artificial intelligence can capture hidden semantic and syntactic patterns, reinforcing the urgency of studying youth exposure to manipulative algorithmic environments.

Although frequently conflated, filter bubbles and echo chambers reflect distinct though interrelated mechanisms of information isolation. A filter bubble refers to the personalization effects of algorithmic curation that limit exposure to diverse viewpoints [7], while an echo chamber emerges through selective social interaction and confirmation bias, where users engage primarily with like-minded others [8]. Recognizing this conceptual distinction is critical for understanding how algorithms and social dynamics jointly shape youth engagement with digital information.

A key outcome of this algorithmic curation is the formation of filter bubbles. Filter bubbles arise when algorithms systematically reduce the diversity of information presented, prioritizing content that resonates with prior interests or opinions while limiting exposure to alternative viewpoints [9]. This process fosters selective exposure and entrenches confirmation bias. Closely related are echo chambers, environments where individuals predominantly engage with like-minded voices, amplifying shared perspectives and marginalizing dissenting ones [5]. Echo chambers are particularly concerned in contexts of political and ideological polarization, where they can deepen divisions and even fuel extremism [10,11]. Complementing this, hybrid feature engineering models like HAPI demonstrate how propaganda on social media can be systematically classified using combinations of linguistic, sentimental, and structural features [12]. The success of these models underscores that algorithmic personalization interacts with strategically designed disinformation, further shaping how young audiences perceive political and social realities.

Another critical dimension in algorithmic bias is the systematic favoritism, embedded within algorithmic systems. Such bias often reproduces prevailing social, cultural, and political hierarchies, shaping users' perceptions of reality by elevating dominant narratives while silencing marginalized ones, frequently without the user's awareness [13,14]. Combined with selective exposure, algorithmic bias exacerbates polarization, spreads misinformation, and undermines democratic discourse [15,16].

For young social media users, these dynamics are particularly consequential. Adolescents and young adults are at a formative stage of cognitive, social, and political development, making them especially susceptible to the subtle influence of algorithmic curation. Their media habits are largely shaped within opaque digital ecosystems whose operations they often do not fully understand [17]. Studies indicate that many young users remain unaware of how algorithms structure their online experiences; even those who are aware often lack the critical skills to diversify their information sources [18,19]. Consequently, algorithms can profoundly shape what young people know, how they interact, and whom they trust, often without conscious recognition. Beyond propaganda, spam detection research shows the effectiveness of contextualized word embeddings such as BERT and ELMo in identifying hidden semantic cues that traditional models miss [20]. These advances highlight that the same technical sophistication driving personalized feeds can also be repurposed to enhance safeguards against manipulative or harmful information flows.

Although research on filter bubbles, echo chambers, and algorithmic bias has grown rapidly, the literature remains fragmented across multiple disciplines, including computer science, communication studies, psychology, and political science. Existing reviews [11]

have synthesized broad insights, yet they typically treat "users" as a homogeneous category, overlooking the distinct vulnerabilities and agency of youth. Much of the scholarship either emphasizes the technical architecture of algorithms or focuses on adult political engagement, with comparatively limited attention to the intersection of algorithmic curation, youth media literacy, and socio-civic outcomes.

This absence of a youth-centered synthesis presents several challenges. First, young people constitute one of the most active user groups on algorithm-driven platforms, making them central to understanding both risks and opportunities [21,22]. Second, as youth are in the process of identity formation, exposure to homogeneous or polarized content can have long-term consequences for their democratic participation, cultural openness, and mental health [23]. Third, without drawing on diverse methodological traditions, ranging from computational audits [13,14] to ethnographic analyses [24], interventions to mitigate these risks are likely to be partial or ineffective.

This review also draws on broader perspectives from media and youth sociology to contextualize algorithmic effects. Scholars such as Sonia Livingstone [25,26] emphasize how digital mediation transforms young people's civic and learning ecologies, while Nick Couldry [27] highlights the symbolic power of platforms in shaping the conditions of public voice and participation. Integrating these perspectives underscores that algorithmic influence extends beyond technical filtering to include deeper sociocultural and normative implications for youth agency and identity.

Against this backdrop, the rationale for the present review is clear: despite urgent global debates over algorithmic personalization and its societal consequences, youth perspectives remain underrepresented in academic discourse. A systematic review consolidating empirical and conceptual scholarship on the intersection of algorithmic curation and youth is essential for informing policy design, platform governance, educational strategies, and future research. This review seeks to bridge disciplinary silos, foreground youth experiences, and provide a coherent evidence base to guide both scholarly debate and practical efforts aimed at cultivating healthier and more diverse online environments for young people.

2. Objectives of the Study

The objectives of the study are as follows:

1. Map the methodological approaches, theoretical frameworks, and platforms studied in youth-related research on filter bubbles, echo chambers, and algorithmic bias.
2. Identify the mechanisms through which algorithms shape youth information exposure, belief formation, and social interaction.
3. Examine documented social, political, and psychological impacts of these phenomena on young people.

3. Methodology

3.1. Review Design and Framework

This study employed a systematic literature review (SLR) methodology to identify, evaluate, and synthesize peer-reviewed empirical research on filter bubbles, echo chambers, and algorithmic bias, with a particular focus on their impact on youth in social media contexts. The review adhered to the PRISMA 2020 guidelines [28] to ensure transparency, replicability, and rigor throughout the process. Following established recommendations [29,30], the review was carried out in four iterative phases: planning and protocol design, literature search and screening, eligibility and quality assessment, and data extraction followed by thematic synthesis.

3.2. Planning and Search Strategy

The search strategy was developed following an initial scoping of foundational scholarship on algorithmic personalization, online polarization, and youth digital behavior [1,9,15]. Based on this scoping, keyword clusters were formulated around four core constructs. Table 1 displays keyword clusters used to retrieve the required literature.

Table 1. Keyword clusters.

Core Construct	Example Keywords
Algorithmic Curation	"algorithmic bias," "recommender systems," "personalization"
Filter Bubbles and Echo Chambers	"echo chamber," "filter bubble," "information cocoon," "content polarization"
Youth and Adolescents	"youth," "teenagers," "young adults," "adolescents"
Social Media Platforms	"Twitter," "Facebook," "YouTube," "Instagram," "TikTok," "Weibo"

A pilot search was conducted to refine platform-specific syntax.

The Boolean search string combined platform-specific and conceptual terms as follows:

("filter bubble*" OR "echo chamber*" OR "algorithmic bias" OR "personalization algorithm*") AND ("youth" OR "adolescent*" OR "young people") AND ("social media" OR "Facebook" OR "Instagram" OR "Twitter" OR "TikTok" OR "YouTube" OR "Weibo").

3.3. Databases Searched

To ensure comprehensive coverage, searches were conducted across ten multidisciplinary and subject-specific databases known for indexing communication, sociology, political science, and computer science research. Table 2 shows the databases utilized to explore the required content from worldwide published studies.

Table 2. Databases searched.

Database	Disciplines Covered
Web of Science (Core Collection)	Multidisciplinary
Scopus	Multidisciplinary, social sciences
Communication & Mass Media Complete (CMMC)	Communication studies
ACM Digital Library	Computer science, technology
IEEE Xplore	Engineering, technology
JSTOR	Humanities, social sciences
SAGE Journals Online	Social sciences, education
Taylor & Francis Online	Social sciences, humanities
SpringerLink	Multidisciplinary
ProQuest Social Science	Social sciences, political science

Additionally, Google Scholar was used for backward and forward citation chasing. Searches were conducted independently by two reviewers between 15 May 2025, and 15 August 2025.

3.4. PRISMA Flow and Screening Outcome

Following title and abstract screening, 163 full-text articles were assessed for eligibility. After applying inclusion and exclusion criteria, 30 studies were retained for final synthesis. Reasons for exclusion at the full-text stage included lack of youth focus, non-empirical design, or absence of algorithmic dimension. The screening process is summarized in the PRISMA 2020 Flow Diagram (Figure 1), adapted from Page et al. [28].

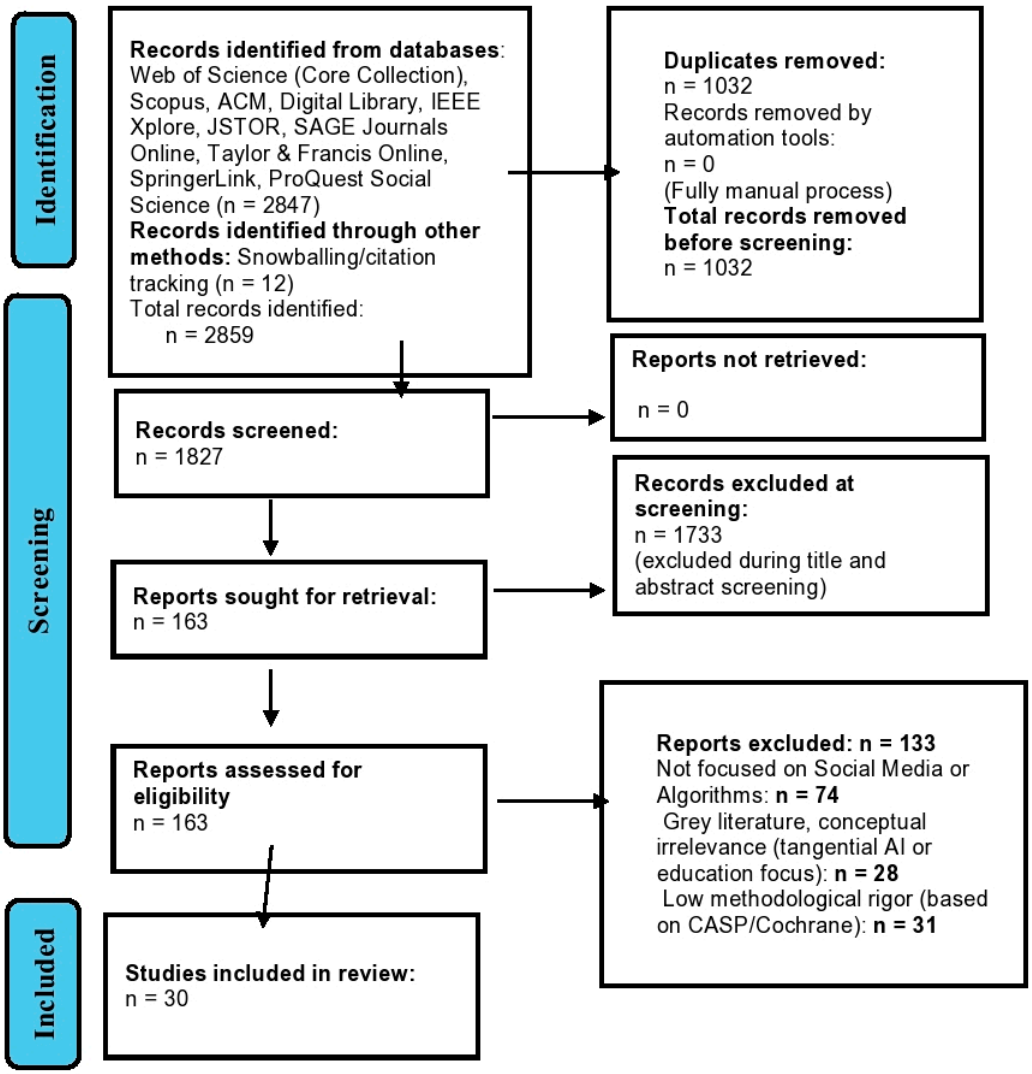

Figure 1. PRISMA 2020 flow diagram for study selection, adapted from Page et al. [28].

3.5. Inclusion and Exclusion Criteria

Eligibility criteria were established in advance to ensure consistency in study selection. Table 3 reveals inclusion and exclusion criteria of the study.

Table 3. Inclusion and exclusion criteria.

Inclusion Criteria	Exclusion Criteria
Peer-reviewed journal articles	Grey literature (blogs, theses, op-eds)
Published 2015–2025	Published before 2015
Written in English	Non-English publications
Focus on filter bubbles, echo chambers, or algorithmic bias	Studies on general internet use without focus on these phenomena
Explicit examination of youth (adolescents, young adults $\leq$ 30)	Studies without youth-specific data or analysis
Any empirical method (qualitative, quantitative, mixed)	Purely theoretical essays, commentaries
Focus on social media platforms (e.g., Facebook, Twitter, YouTube, Instagram, TikTok)	Offline or non-social media contexts

While purely theoretical essays were excluded, three studies integrating conceptual analysis with empirical or computational elements were retained, as they provided theoretical value for the youth-focused synthesis.

Disagreements during screening were resolved by discussion, with arbitration by a third reviewer where necessary.

A potential limitation of the review lies in publication bias, particularly the predominance of English-language and Western-based studies in indexed databases. This overrepresentation may obscure diverse socio-cultural experiences of algorithmic media use in the Global South. Future reviews could mitigate this issue by incorporating multilingual searches and fostering collaborations with Global South research networks.

3.6. Quality Appraisal

Quality assessment was performed using tools that align with the study designs of the included articles. Table 4 displays the quality assessment tool. Out of all the included studies, 19 were rated high quality, 9 moderate, and 2 low but acceptable (due to limited transparency in sampling or analysis). Inter-rater reliability was assessed using Cohen's Kappa ($\kappa = 0.84$), indicating strong agreement between reviewers during both the screening and quality assessment phases [31].

Table 4. Quality assessment tool.

Study Design	Quality Assessment Tool	Reference
Qualitative studies	CASP (Critical Appraisal Skills Programme)	CASP [32]
Mixed-methods studies	MMAT (Mixed Methods Appraisal Tool)	Hong et al. [33]
Cross-sectional surveys	AXIS (Appraisal of Cross-Sectional Studies)	Downes et al. [34]

3.7. Synthesis Approach

Given the methodological heterogeneity of the included studies, a narrative thematic synthesis was adopted to integrate and interpret the findings. To ensure analytical clarity, the studies were organized into four thematic clusters: algorithmic processes, which examined how algorithms shape exposure and interactions; youth behavioral responses, focusing on awareness, adaptation, and resistance strategies; socio-political impacts, including polarization, civic engagement, and misinformation; and interventions and solutions, addressing policy reforms, media literacy initiatives, and design-based approaches. Thematic maps and comparative tables were developed to visualize both convergences and divergences across the studies. Evidence gaps were explicitly highlighted, enabling a nuanced understanding of where current scholarship converges and where further investigation is warranted. This approach ensured that the synthesis captured not only the breadth of available research but also the specific nuances of youth-centered dynamics in the social media landscape.

3.8. Data Extraction and Coding

Following the final selection of studies, data were systematically extracted using a standardized template to ensure both consistency and comparability. For each study, key information was recorded, including study design, youth demographics (age range and operational definition of "youth," where applicable), platform(s) examined, algorithmic focus (e.g., filter bubbles, echo chambers, algorithmic bias, amplification), primary findings related to youth exposure, beliefs, and socio-civic outcomes, as well as relevant methodological considerations. The coding framework combined deductive categories derived from the review's core constructs with inductive codes emerging directly from the data, following the six-step thematic analysis process proposed by Braun & Clarke [35]. In cases where studies were not exclusively youth-focused but offered strong mechanistic insights relevant to youth, they were clearly marked as "general users; youth-relevant" and retained for synthesis.

3.9. Ethical Considerations

As this review relied solely on published and publicly available academic literature, no formal ethical approval was required. All studies were accessed through institutional subscriptions or open-access repositories, and appropriate citation practices were followed to ensure academic integrity and proper acknowledgment of original sources.

3.10. Registration Statement

This study was not preregistered in PROSPERO or any other database, as it was conducted retrospectively based on previously published literature. However, all procedures adhered to the PRISMA 2020 guidelines to ensure methodological rigor, transparency, and reproducibility.

4. Results

4.1. Overview of Included Studies

This review synthesized 30 peer-reviewed journal articles published between 2015 and 2025, investigating the influence of filter bubbles, echo chambers, and algorithmic bias on youth and young adults within social media environments. The studies encompassed a range of methodologies, including computational audits, simulation modeling, experimental and survey-based research, qualitative ethnographies, and mixed-methods designs.

While several studies explicitly targeted youth populations [17,19,36], others examined general social media users but provided findings with strong relevance to youth engagement, civic participation, or susceptibility to algorithmic curation [1,15]. Together, these studies offer insight into:

- the mechanisms by which algorithmic systems shape online information exposure,
- the extent of ideological segregation in social networks,
- the socio-psychological and contextual factors influencing youth susceptibility to polarization, and
- potential pathways for intervention, including media literacy and platform design changes.

4.2. Descriptive Characteristics of Included Studies

Table 5 presents the descriptive characteristics of the 30 included studies, organized by author, study design, country/region, platform(s), and thematic focus.

Table 5. Characteristics of included studies.

No.	Author(s) & Year	Study Design	Country/Region	Platform(s)	Thematic Focus
1	Bakshy et al. [1]	Large-scale computational analysis	USA	Facebook	Exposure to ideologically diverse news
2	Flaxman et al. [9]	Quantitative web traffic analysis	USA	Google News, social media	Filter bubbles and news consumption
3	Guess et al. [15]	Field experiment	USA	Facebook, Instagram	Algorithmic feeds and political attitudes
4	Chen et al. [37]	Experimental audit with bots	USA	Twitter	Detecting political bias in curation
5	Metaxa et al. [13]	Systematic audit study	USA	Multiple platforms	Bias in algorithmic audits

Table 5. *Cont.*

No.	Author(s) & Year	Study Design	Country/Region	Platform(s)	Thematic Focus
6	Srba et al. [14]	Algorithm audit & content analysis	Slovakia	YouTube	Misinformation filter bubbles
7	Kulshrestha et al. [4]	Quantitative bias measurement	Germany/USA	Facebook, Google	Political bias in search & feeds
8	Sîrbu et al. [38]	Simulation modeling	Italy	Generic networks	Algorithmic bias amplifying polarization
9	Baeza-Yates [3]	Conceptual & empirical synthesis	Chile/USA	Web	Web bias and fairness
10	Berman & Katona [2]	Simulation & network analysis	USA	Generic networks	Filter bubble formation
11	Papakyriakopoulos et al. [39]	Computational communication analysis	Germany	Twitter	Hyperactive users & recommender bias
12	Bishop [24]	Qualitative digital ethnography	UK	YouTube	Algorithmic gossip & visibility
13	Bucher [40]	Qualitative interviews	Norway	Facebook	Algorithmic imaginary
14	Ledwich & Zaitsev [41]	Data-driven analysis	Australia	YouTube	Radicalization & algorithmic extremism
15	Shmargad & Klar [42]	Online experiment	USA	News ranking platforms	Popularity ranking & polarization
16	de Groot et al. [17]	Mixed-methods (survey + interviews)	Netherlands	Instagram, TikTok, YouTube	Youth awareness of algorithms
17	Cakmak, Agarwal, & Oni [22]	Computational audit	USA	YouTube	Drift in recommendation bias
18	Broto Cervera et al. [21]	Social network analysis	Spain	Twitter	Echo chambers & bots
19	Chueca Del Cerro [43]	Agent-based modeling	Spain	Generic networks	Polarisation dynamics
20	Sindermann et al. [19]	Survey study	Germany	Multiple	Personality & bubble susceptibility
21	Peralta et al. [44]	Simulation	Hungary	Generic networks	Opinion formation with bias
22	Baumgaertner & Justwan [18]	Experimental survey	USA	Multiple	Belief preference & polarization
23	Guo, S. et al. [23]	Comparative network analysis	China/USA	Twitter, Weibo	Personality traits & echo chambers
24	Aydoğan & Köse [45]	Qualitative descriptive	Turkey	Multiple	Freedom of expression & echo chambers
25	Qian & Wang [16]	Network/content analysis	China	Weibo	Echo chambers in COVID-19 rebuttals
26	Ackermann & Stadelmann-Steffen [46]	Survey	Switzerland	Facebook, Twitter	Online activity & voting
27	Avnur [47]	Philosophical/theoretical	USA	Multiple	Motivated reasoning in echo chambers

Table 5. *Cont.*

No.	Author(s) & Year	Study Design	Country/Region	Platform(s)	Thematic Focus
28	Coady [48]	Critical conceptual analysis	Australia	Multiple	Rethinking filter bubbles
29	Geschke et al. [10]	Agent-based modeling	Germany	Generic networks	Triple-filter bubble dynamics
30	Terren & Borge [11]	Literature review	Spain	Multiple	Echo chambers research synthesis

Note: Studies are listed randomly, and no chronological order of publication was followed.

4.3. Methodological Typology

The included studies reflected diverse methodological approaches, with computational audits and modeling dominating, while survey-based and ethnographic approaches highlighted the youth perspective. Figure 2 shows methods employed in the selected studies.

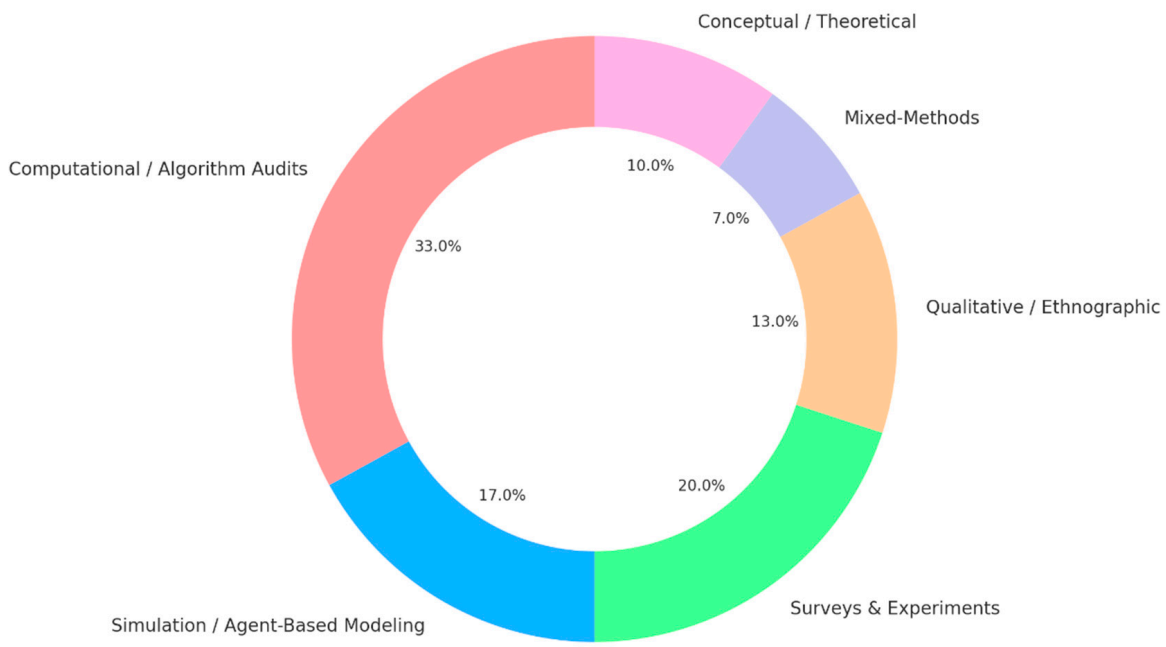

Figure 2. Research methods employed in the studies.

It illustrates the proportion of studies conducted under various research design methodologies. Computational/Algorithm Audits dominate with 33% of the studies, followed by Simulation/Agent-Based Modeling (17%) and Surveys & Experiments (20%). Qualitative/Ethnographic approaches account for 13% of the studies, while Mixed-Methods and Conceptual/Theoretical methodologies make up 7% and 10%, respectively.

4.4. Geographic Distribution

Figure 3 displays the distribution of studies across different regions, highlighting both youth-specific studies and non-youth-specific studies. The chart shows that the USA has the highest number of total studies (11), with a significant portion (3) focused on youth. Western Europe follows with 9 studies, 4 of which are youth-specific. Other regions, such as Eastern Europe (3 studies), Asia-Pacific (4 studies), Australia (2 studies), and Latin America (1 study), show fewer total studies, with a varying proportion of youth-specific research. The stacked structure of the chart allows for a clear visual comparison of the study types within each region.

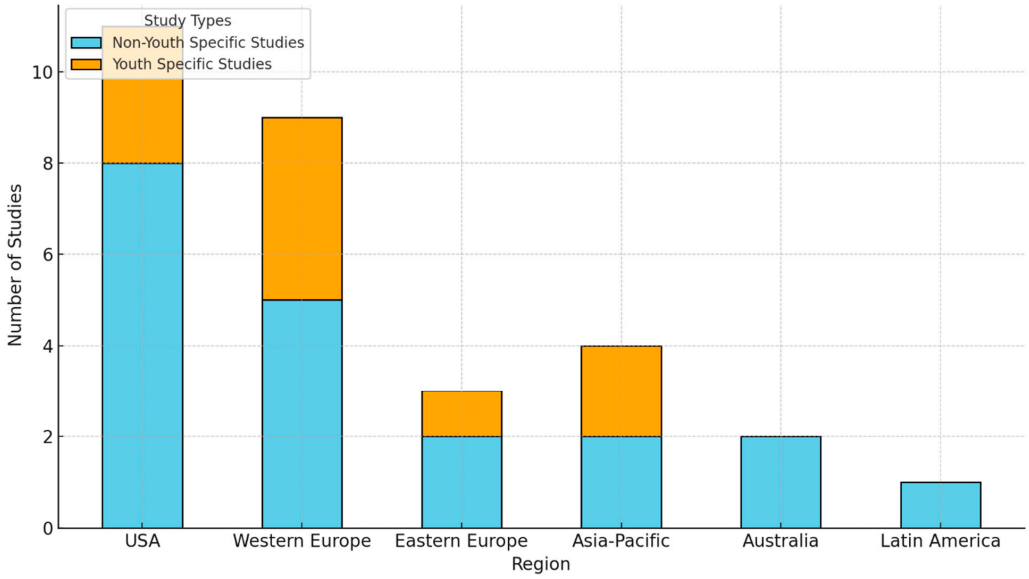

Figure 3. Geographic distribution of studies by region.

4.5. Temporal Trends (2015–2025)

The timeline of publications reveals a strong growth in interest after 2018, aligning with heightened public concern over misinformation and political polarization. More recent studies (2023–2025) are notable for their emphasis on youth-centered perspectives and cross-cultural comparisons. Figure 4 shows the distribution of studies over time, from 2015 to 2025, with notable trends emerging in different periods. The chart highlights the growth in the number of studies, particularly after 2018, when topics like polarization, radicalization, and personality traits took center stage. The trend continues to rise in the years 2021–2023, focusing on youth awareness and misinformation. The most recent studies (2024–2025) reflect a shift toward global comparisons and a growing concern around the drift in recommendations. The chart clearly shows the increase in research volume, with each period color-coded for easy identification of themes tied to the studies.

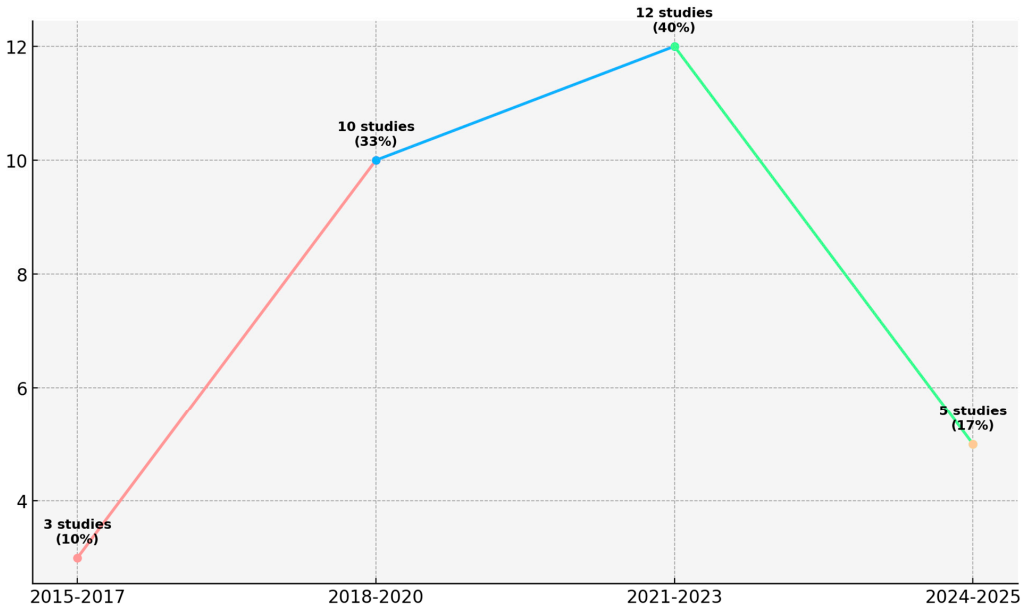

Figure 4. Temporal trends (2015–2025).

4.6. Thematic Synthesis of Findings

Figure 5 illustrates the distribution of studies across four thematic clusters. Algorithmic Processes comprises the largest portion, accounting for 40% of the studies, followed by Socio-Political Impacts at 27%. Youth Behavioral Responses represents 20% of the studies, while Interventions & Solutions makes up the smallest share at 13%. This chart highlights the relative focus of research on algorithmic risks and socio-political effects, while emphasizing the relatively lesser attention on interventions and solutions.

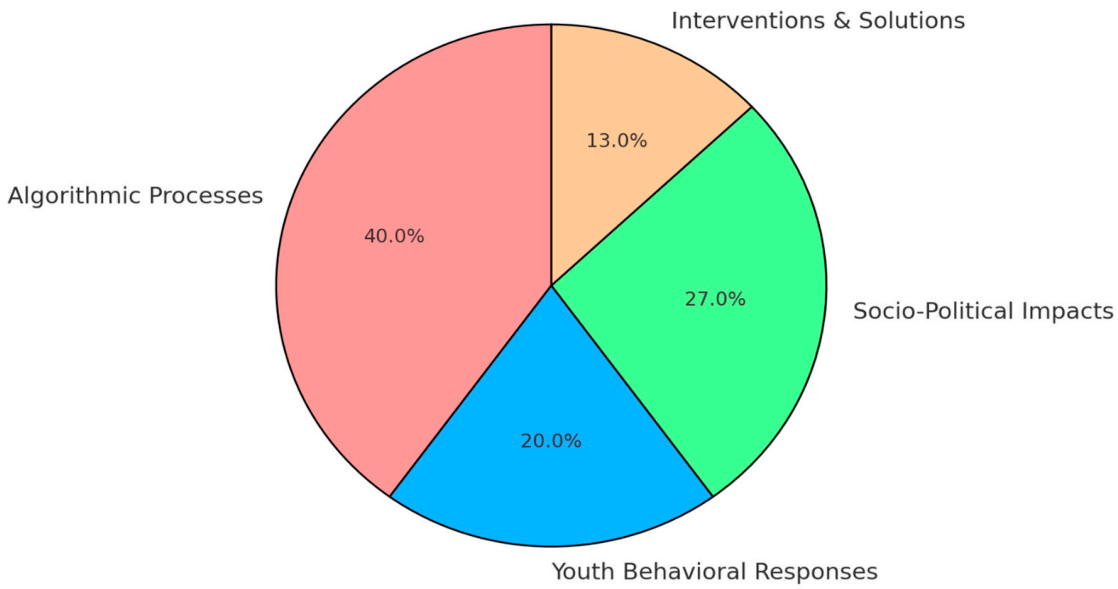

Figure 5. Thematic synthesis of findings.

4.7. Theoretical Framework Usage

Figure 6 shows distribution of theoretical frameworks across studies. Each node represents a distinct theoretical framework, with node size proportional to frequency of use.

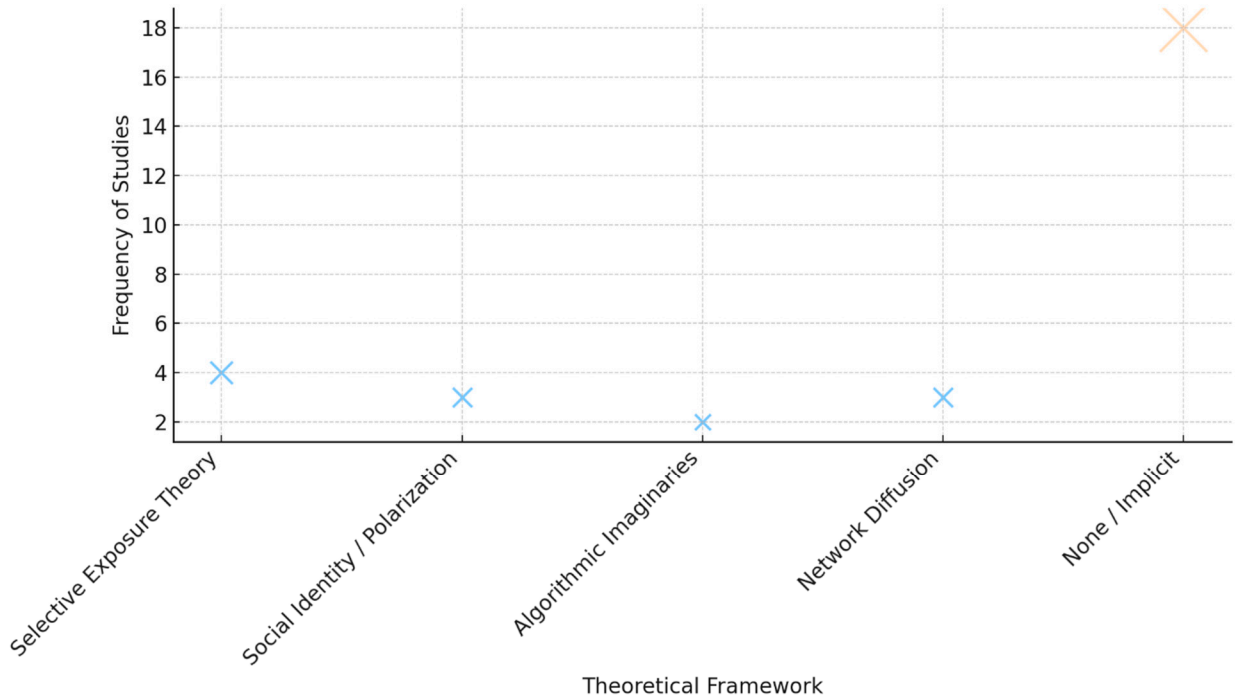

Figure 6. Theoretical framework usage.

4.8. Methodological Limitations Identified

Table 6 summarizes the main methodological limitations reported across 30 studies. The most frequent issue was Western bias (15/30), followed by the lack of longitudinal data (12/30). Algorithm opacity was noted in 10 studies, while youth-specific sampling gaps (8/30) and small qualitative samples (4/30) highlighted weaknesses in representativeness and external validity. Collectively, these limitations point to the need for more diverse, longitudinal, and youth-focused research.

Table 6. Common limitations.

Limitation	Studies Reporting	Consequences
Western bias	15/30	Limited generalizability
Lack of longitudinal data	12/30	No evidence of sustained effects
Algorithm opacity	10/30	Reliance on black-box inference
Low youth-specific sampling	8/30	Gaps in adolescent-focused findings
Small qualitative samples	4/30	Weak external validity

4.9. Most Frequently Used Terms and Concepts

Terms like algorithmic bias, social media, youth engagement, and polarization dominate the word cloud, emphasizing their central role in the research. Figure 7 aggregates the most significant keywords from various thematic clusters within the study in a word cloud figure. It highlights the primary areas of focus, such as the impact of algorithmic bias on social media, the role of youth engagement in polarization, and the increasing concern over filter bubbles and echo chambers. The size of each word reflects its relevance and frequency in the research corpus, offering an intuitive understanding of the key issues addressed in the literature. This figure supports the ongoing narrative by visually reinforcing the dominance of these themes and their intersection with socio-political factors, media literacy, and digital youth behavior.

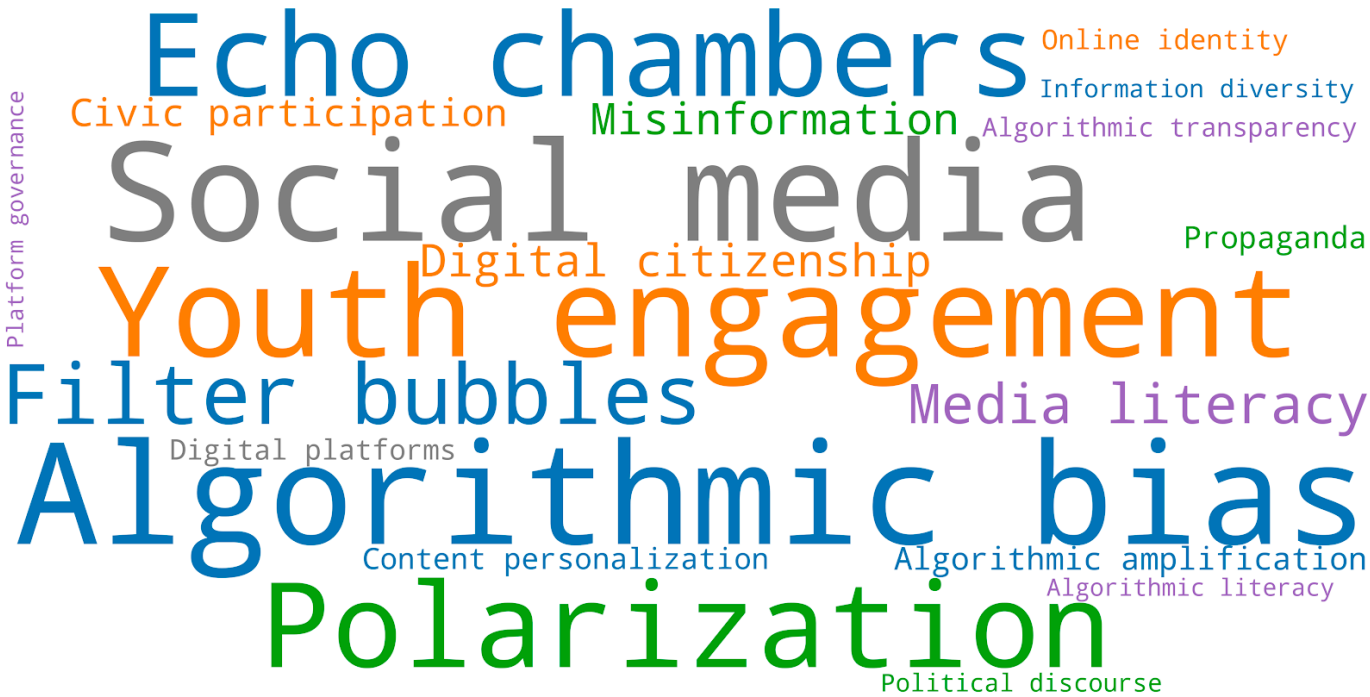

Figure 7. Frequently used terms and concepts.

4.10. Platform-Specific Distribution

Figure 8 visualizes 30 studies across five platforms. Facebook (7) is primarily linked to polarization, with strong youth relevance. YouTube (6) is associated with radicalization, showing very strong youth relevance. Twitter/X (6) emphasizes echo chambers with moderate youth impact. Instagram/TikTok (2) explore algorithm awareness, assessed as under-researched but strong. Multi-platform studies (9) cover comparative bias, with varied relevance. The flow widths correspond to the number of studies, showing that multi-platform and Facebook research dominate, while TikTok/Instagram remain under-studied.

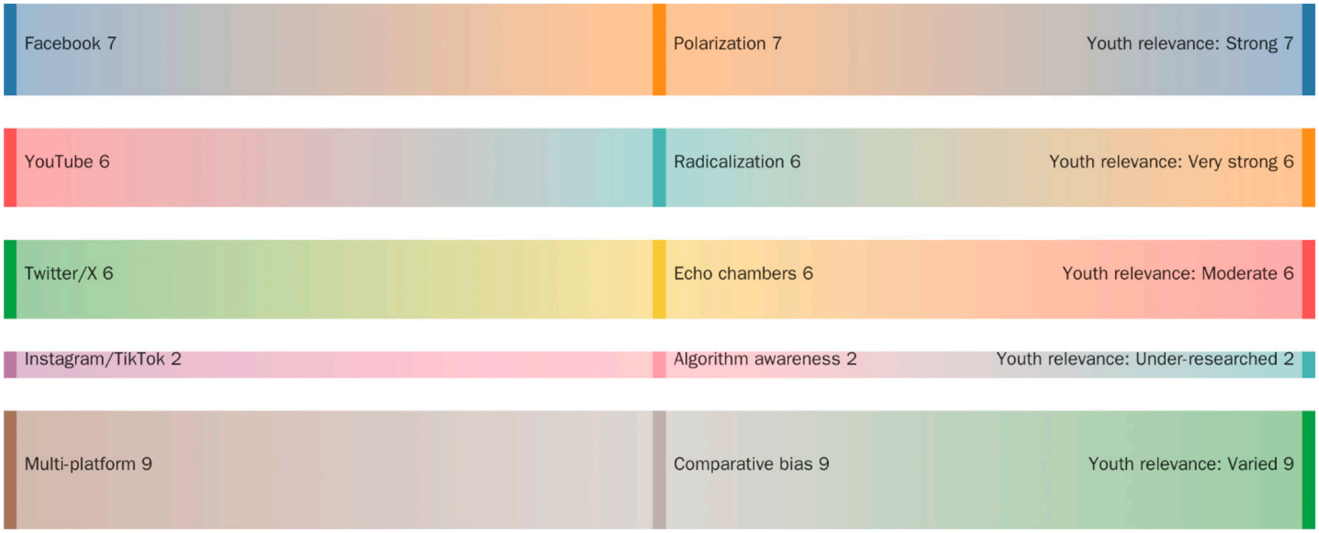

Figure 8. Characteristics and population focus.

5. Discussion

This systematic review synthesized a decade of peer-reviewed scholarship (2015–2025) on filter bubbles, echo chambers, and youth engagement within algorithmically curated social media environments. Drawing from 30 studies across Europe, North America, Asia, and cross-regional contexts, the findings reveal both convergence and divergence in how researchers conceptualize, measure, and interpret the interplay between platform algorithms, selective exposure, and youth agency. While early work [1,9] approached algorithmic effects primarily through large-scale computational analysis of exposure diversity, more recent studies expand the scope to include youth awareness, critical literacy, identity formation, and cross-cultural contexts [17,45]. Across methodological traditions, audits, simulations, surveys, ethnographies, and conceptual analyses, three dominant patterns emerged.

First, there is a consistent observation across computational audits and simulation studies that platform curation systems amplify ideologically homogeneous content, reinforcing confirmation bias and limiting incidental exposure to diverse viewpoints [1,4,37]. These structural dynamics provide the "default" informational environment in which youth engagement unfolds. Simulation models highlight how small initial biases are magnified by recommender systems, producing polarization cascades at the network level [2,10,38]. Evidence from YouTube demonstrates how personalization drifts toward sensationalist and radical material [14,41,49]. Such findings underscore that algorithmic bias is not a marginal technical quirk but a structural driver shaping everyday media diets. For youth, this environment is especially influential: platforms such as TikTok, Instagram, and YouTube are central not only for entertainment but also for identity work and civic socialization [17]. The narrowing of exposure may thus have longer-term consequences for political learning and civic participation.

Contrary to deterministic accounts of "algorithmic capture," the reviewed studies highlight significant but uneven youth agency. Survey and interview-based research suggests that many young people possess a partial awareness of algorithmic personalization and actively attempt to diversify their feeds, for example by following cross-cutting accounts or using secondary platforms [17,19]. Ethnographic accounts further show that youth sometimes resist or parody algorithmic power through practices of "algorithmic gossip" and irony [24,40]. Yet, this agency is constrained. Opaque platform architectures limit the effectiveness of user strategies, while broader political and cultural contexts shape the space for resistance. In authoritarian or highly polarized societies, youth face added pressures: in Morocco, YouTube echo chambers around rap culture reveal how algorithms intersect with socio-political marginalization [50]; in Turkey, restrictive environments amplify the chilling effects of echo chambers on freedom of expression [45]. In China, echo chambers during COVID-19 rumor rebuttals demonstrated how algorithmic amplification interacts with state-directed discourse [16]. Together, these cases illustrate that while youth are not passive, their ability to exercise agency varies dramatically by context.

A third key theme is the intertwining of algorithmic curation with identity processes. Experimental and survey studies confirm that curated feeds can strengthen partisan attitudes and affective polarization [18,42]. For youth, however, polarization is not experienced only as political division but also as cultural and subcultural identity reinforcement. Ethnographic and qualitative studies describe how algorithmic environments facilitate the co-creation of shared vocabularies, memes, and humor that both strengthen in-group belonging and exclude outsiders [24,45]. Comparative work shows that individual differences such as personality traits also mediate susceptibility to echo chamber effects [19]. Taken together, this suggests that algorithms do not only "trap" youth in bubbles but also furnish symbolic resources for identity work, making interventions more complex than simply diversifying exposure.

The findings also indicate that technological fixes alone, such as minor tweaks to recommendation algorithms, are insufficient. While algorithmic transparency and auditing are necessary [14,22], they must be complemented by investments in youth-centered algorithmic literacy. Programs should move beyond basic fact-checking to equip young users with knowledge about data collection, personalization processes, and strategies for intentional content diversification. For policymakers, the findings highlight an urgent need for regulatory frameworks that ensure accountability in recommendation systems. The European Union's Digital Services Act is one step forward, but youth-specific protections remain underdeveloped [51]. NGOs and educational institutions should work with platforms to implement better design interventions, such as customizable feed options, that balance user empowerment with systemic safeguards.

Methodological Gaps and Future Research

This review identified four recurring methodological limitations that shape the current evidence base. First, there is a marked geographic imbalance, with most studies focusing on the United States and Western Europe, leaving youth in the Global South largely underrepresented. Only a few investigations address non-Western contexts, such as Morocco [50], Turkey [45], or China [16], limiting the generalizability of findings across diverse political and cultural environments. Second, the literature demonstrates significant temporal blindness, as very few studies adopt longitudinal designs. This gap restricts our understanding of how filter bubble and echo chamber effects evolve over time, particularly during critical developmental stages of political socialization and civic identity formation. Third, there is a reliance on fragmented methodological approaches: computational audits and modeling studies often provide detailed insights into algorithmic structures but remain disconnected

from the lived experiences of youth, whereas qualitative and ethnographic accounts offer depth but lack generalizability.

Mixed-method approaches that could bridge these divides remain scarce. Finally, the field is hindered by conceptual ambiguity. Key terms such as "filter bubble" and "echo chamber" are frequently used interchangeably despite their distinct theoretical origins, leading to inconsistencies in operationalization and synthesis across studies [48]. Addressing these gaps will require more geographically inclusive, temporally sensitive, methodologically integrated, and conceptually precise research agendas. Future research should therefore adopt cross-cultural comparative designs, employ multi-platform approaches, and incorporate experimental intervention testing to evaluate the impact of literacy training or algorithm redesigns.

To address this gap, future studies could establish regional research consortia or partnerships with Global South universities to ensure inclusion of diverse cultural and linguistic contexts. Additionally, supporting open-access repositories for non-English publications and youth-centered participatory research can foster more equitable global knowledge production.

Overall, the findings highlight that while algorithms contribute to ideological segmentation, young people are not passive consumers. Many demonstrate adaptive strategies, such as cross-platform verification and intentional content diversification, that reflect emerging forms of algorithmic literacy. Cultivating these skills through media education could mitigate the isolating effects of personalized information flows.

6. Conclusions

This review shows that filter bubbles and echo chambers are socio-technical phenomena, products of algorithmic design, user agency, and broader cultural and political contexts. Youth are neither passive victims of algorithmic determinism nor fully autonomous navigators of their digital worlds; rather, they negotiate complex environments shaped by both constraint and creativity. The challenge for researchers, educators, and policymakers is to move beyond binary framings of "trapped versus free" and to cultivate approaches that recognize youth as active participants in algorithmically mediated publics. Addressing risks will require a dual strategy: structural reforms in platform governance and deep, critical algorithmic literacy embedded in education. Only by combining these can we ensure that young people are not merely surviving but thriving in an algorithmic society.

Author Contributions: Conceptualization, M.A.; Methodology, M.A. and K.S.; Validation, M.A. and K.S.; Formal analysis, M.A.; Investigation, M.A.; Resources, A.I. and M.L.; Data curation, A.I. and M.L.; Writing—original draft preparation, M.A.; Writing—review and editing, K.S.; Visualization, A.I. and M.L.; Supervision, M.A.; Project administration, M.A.; Funding acquisition, A.I. and M.L. All authors have read and agreed to the published version of the manuscript.

Funding: This research received no external funding. The authors gratefully acknowledge the support and cooperation provided by Prince Sultan University, KSA, which facilitated the completion of this study. The Article Processing Charge (APC) was funded by Prince Sultan University, KSA.

Institutional Review Board Statement: Not applicable.

Informed Consent Statement: This study did not involve human participants; therefore, informed consent was not required.

Data Availability Statement: All data analyzed in this study were derived from publicly available, peer-reviewed journal articles identified through academic databases. No new empirical data were generated. The datasets extracted from the 30 selected studies are summarized in Table 5.

Conflicts of Interest: The authors declare no conflicts of interest.
